# Noise - Acoustic Building Code Regulations

In Australia, the NCC Part F5.5 Deemed-to-Satisfy provisions states that Class 2 buildings; typically apartments and multi-residential, and class 3 buildings; hotels and motels, have entry doors with a minimum sound insulation rating of  $R_W30$ . The UK Building Approved Document E states a minimum  $R_W29$  is required.

Raven acoustic seals are used in airports, hotels, offices, hospitals, homes and anywhere noise infiltration occurs through doors. Their effectiveness is best illustrated by the repeated use of Raven seals by architects, acoustic engineers, door fabricators, and project builders.

Raven, the industry leader in door sealing systems, pioneered baseline acoustic testing, utilising "off the shelf" doors and ironmongery to give specifiers proven, cost effective solutions to the growing problem of noise in living and workplace environments.

Acoustic door manufacturers increasingly incorporate Raven door sealing systems with acoustically engineered doors to achieve and maintain the highest  $R_W$  ratings up to  $R_W52$ .

# Improving R<sub>W</sub> Ratings

It should be considered that the  $R_W$  rating of a door set is only as good as the sum of its parts, i.e. the  $R_W$  value of the door set, fitted with Raven acoustic seals and the wall in which the door assembly is fitted. The use of soft absorbent furnishings within a room will also help absorb unwanted noise. All these measures will improve the acoustic attenuation of the room.

Typically, when Raven acoustic seals are fitted to timber solid core doors the  $R_W$  rating of the door assembly is increased from around  $R_W16$  up to  $R_W32$ . When the assembly is placed into an  $R_W55$  wall, the overall rating of the door assembly and wall combination drops as a ratio to area. The larger the wall area the less the combined  $R_W$  rating will drop.

### **AUS National Construction Code (NCC) Part F5**

Class 2 to Class 9 buildings

#### F5.5 Sound insulation rating of walls

- (a) A wall in a Class 2 or 3 building must:
  - (i) have an  $R_W + C_{tr}$  (airborne) not less than 50, if it separates sole-occupancy units; and
  - (ii) have an R<sub>W</sub> (airborne) not less than 50, if it separates a sole-occupancy unit from a plant room, lift shaft, stairway, public corridor, public lobby or the like, or parts of a different classification; and
  - (iii) comply with **F5.3(b)** if it separates:
    - (A) a bathroom, sanitary compartment, laundry or kitchen in one sole-occupancy unit from a habitable room (other than a kitchen) in an adjoining unit; or
    - (B) a sole-occupancy unit from a plant room or lift shaft.

(b) A door may be incorporated in a wall in a Class 2 or 3 building that separates a *sole-occupancy unit* from a stairway, *public corridor*, public lobby or the like, provided the door assembly has an R<sub>W</sub> not less than 30.

## **Acoustic Standards, Test Methods and Ratings**

The test methods used to establish the sound attenuation ability of a door set is AS 1191, ISO 140 series and recently EN ISO 10140 series standards. Test data from any one of these test methods can be used in EN ISO 717-1 which provides a single number rating across a spectrum of frequencies for the sound attenuation performance of the building element. Typically  $R_{\rm W}$  is used for door sets that cover frequencies from 100Hz to 3150Hz.

## **Related Building Codes**

There are several standards, which refer to seal properties and testing for noise - acoustic:

#### AUS/NZ

Requirements are noted in the Australian National Construction Code (NCC) and New Zealand NZ BC Compliance Doc. G.

#### UK / EL

Requirements are noted in the British Building Regulations Approved Document E.

#### USA

Requirements are noted in the Building Code and the Residential Code IBC 2000.

For further details, refer to Standards / Authorities on page 122.
